

SanDiaril

Box of 60 capsules

Box of 90 capsules

Complex herbal compound for the treatment of sudden and acute diarrhea, or for the treatment of chronic diarrhea.

Acute and chronic diarrhoea:

Acute diarrhoea are ascribable to germs (salmonellas, colibacillus), parasites (amoebas) or to viruses (enteroviruses); they can last from one to seven days (or sometimes more).

They can be caught by the ingestion of infected food or water. Beyond the discomfort that acute diarrhea can cause, the risk of dehydration is the principal danger particularly for the fragile people and infants.

Chronic diarrhea are characterized by the frequent emission of liquid feces (or very soft stools) over rather long periods going from eight to twenty days and even more. Several causes can be at the source of the chronic diarrhea condition:

- Lesion of the intestinal wall due to an inflamed tumour
- Insufficient or poor absorption of food (intolerance to gluten)
- Hyperactivity of the intestinal transit (often caused by a hyperthyroidism) • Pathological secretion of the intestinal epithelium (mucous enteritis)

In the cases of chronic diarrhea it is important to clearly identify the cause in order to undertake the adapted treatment. The consultation of a physician is advised.

Action of SanDiaril:

SanDiaril is composed of specific plants and natural substances, which act on the fabric of the intestinal wall in order to reabsorb the inflammations while reducing the movement of the longitudinal and circular smooth muscles responsible for the peristalsis and the spasms. Certain plants stimulate the absorption of water by intestinal fabric in order to reduce the phenomenon of dehydration and subsequently to increase the density of the stools. Lastly, other plants act by way of disinfectant to fight germs, viruses and parasites.

SanDiaril does not contain any antacid products; it does not modify the acidity balance of the stomach and digestive system.

Instructions:

Acute diarrhea: Take 2 capsules as of the first symptoms. Take 2 others capsules 3 or 4 hours later. Repeat if need be, up to 6 capsules per day.

Chronic diarrhea (of which Crohn's disease): During the first three days, take 2 capsules after each meal (6 capsules per day). Thereafter, take 1 capsule after each meal (3 capsules per day) until the regularization of the intestinal transit then you can reduce to two or even one capsule per day.

Composition:

Cupressus sempervirens, Curcuma longa, Acacia xanthophloea - Plant origin capsules.

Complementary treatments:

DynOrgan is a depurative that cleans vital organs and ensures the proper functioning and the stimulation of those organs (namely: the liver, spleen, pancreas, kidneys and gall-bladder). DynOrgan stimulates the hepatic and digestive functions. It is important that the food is well digested in order to avoid intestinal fermentation and to ensure a proper absorption of the nutriments.

After an episode of acute diarrhea, it can be salutary to undertake a DynOrgan cure, by taking two capsules with a little water three times per day after the meals, during 10 days (that cure should be repeated every 3 to 4 months). In the cases of chronic diarrhea, DynOrgan can be used as a follow-up treatment (by taking one to two capsules per day after the evening meal) it ensures a better digestion of food and its absorption at the intestinal level.

Deflatil is composed of plants that inhibit the formation of gas by limiting the fermentations and the presence of moulds in the intestines. Deflatil is also very effective in the cases of intestinal inflammations and diverticulitis.
